Method 11 Muskox

Length: (L) Measure the length of each horn from the center of the boss to the tip, following along the center of the horn surface. Use a hooked ¼-inch tape or steel cable with a button (rivet) end. Place masking tape both on the center of the boss and top of the horn towards the tip. Mark the center of the boss and the path towards the tip with a pencil on the tape. Do this for both horns. Start the tape/cable at the bottom of the boss in the valley between the two horns by hooking it around the edge of the horn. Then measure almost straight up to the top of the marked center point of the boss, from there turn down while staying on top of the horn on the marked path. From here, measure toward the tip while keeping the tape on the center of the horn at all times. If the horn tip is broken or worn, card off. (See General instructions in Measurers Handbook.)

Width: (W) Using a caliper, measure each boss at its greatest width. Make sure your measurement is parallel to the center axis of the skull. Do not measure "green" or "soft" boss material. Make sure the caliper is tight along the horn but not so tight that that it snaps inward once it is removed from the horn but not too loose around the horn either. It must touch horn when being removed from the skull so that the space can be measured with an inch tape.

Greatest Spread: (G) Measure the greatest outside spread. Establish the outer limits of the horns using two carpenter's triangles. Measure the greatest spread in a straight line and at a right angle to the axis of the skull. Lay the horns and skull on a smooth, flat surface such as a clean concrete floor and then place two large carpenter's triangles (on both ends of the horns, making sure that both triangles are at a 90-degree angle to the axis of the skull. Mark with a pencil where the carpenter's square reaches the surface (both sides), push the horns and triangles away, and measure the distance between the two marks. Do not measure from a wall above the horns and skull to a single carpenter's triangle because an air measurement may lead to a tape measure sagging, and this will increase the score.

Comments (Note trophy repairs, remeasuring, and so on, here):
