West African Buffaloes and Dwarf Buffaloes.

Length: Measure each horn on the outside curve. Start on the side of the skull and measure along the front edge, keeping to the outside surface and continuing to the tip. **(L)** In order to find the starting point **(A)** for the horn length lay the long leg of a carpenter's square against the bottom most part of the boss and place the shorter leg of the square against the inner part of the boss between the horns. Make sure one leg is exactly parallel to the axis of the skull. Now divide the 90 degree angle into half and mark this spot **(A)** on the edge of the boss. This is the starting point for measurement **(L)**. Figures 1 & 2. **A boss that has been enhanced by taxidermist materials disqualifies the head for Rowland Ward.**

Width: Using a tape, measure each horn at its greatest width at a 90 degree angle to the axis of the horn. **(W)** Do not measure "green" or "soft" boss material. Depending on the horn configuration it can be possible to take a "circumference" measurement for the width. Only measure the top 50% of the horn for the width; as soon as the horn starts curving inward stop the width measurement. Boss measurements may not be taken outside the outer edge of the eye sockets. Figure 1 and 3.

Tip to Tip: Measure the Tip to Tip spread
from the center of one horn tip to the other. **(E)**
